There are issues when sharing files that are created on Windows machines when using the file on a linux-based machine (including MacOS). This is related to the way a computer defines a new line (`\n` in linux and `\r\n` on Windows).

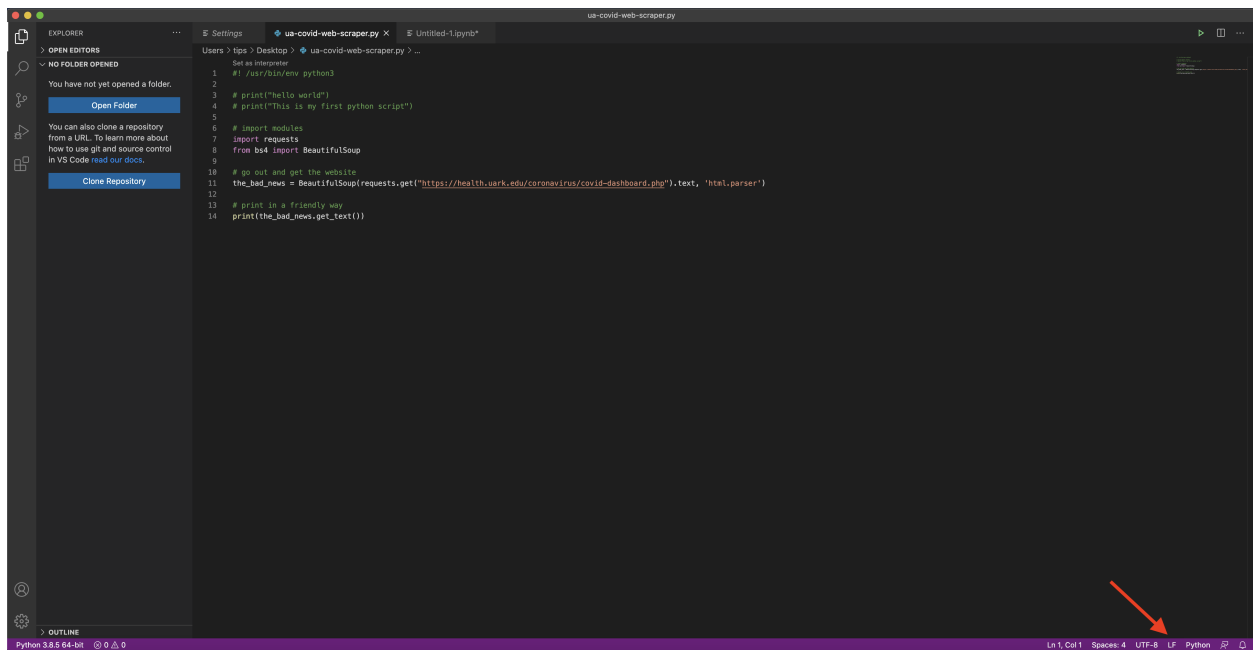

To get to the options to change the line files, open the settings by clicking the gear icon in the lower left and then choose settings.

Once the settings window opens, in the search bar at the top of the window, search for `end of line` and hit return. This will open a bunch of options. In the option **Files: Eol** there will be a drop-down menu. Choose the drop down menu and select the `\n` option. At the bottom of the drop-down menu, this will then show **LF**.

Open up a new python script and verify that the end of line file type is LF in the lower menu bar. If the end of line file type shows CRLF, quit and restart VS code. If the end of line file is still CRLF repeat the process listed above.
